INTRODUCTION

Binary option trading is a type of financial trading in which a trader predicts whether the price of an asset such as stocks, currency, gold, or an index will go up or down within a fixed period of time. It is called "binary" trading you must also maintain proper discipline and composure as you trade. The final ingredient to begin earning 90% a minute is choosing a broker to implement your strategy for your convenience we have paired each strategy with a trusted broker where you can start earning you 80% today!

what are binary option ?

Binary options are a simple way to participate in the movement of financial assets they are binary in nature in that there are only two possible results either you earn a fixed profit if your prediction is correct, or you lose the invested amount if your prediction is wrong. Traders usually select a short time frame like 1 minute, 5 minutes, or 15 minutes and choose Call (price will go up) or Put (price will go down). Binary options trading is simple to understand but it is important to learn market ..

advantage of binary option trading

Binary options trading has several advantages that make it popular among beginners and short-term traders. It is simple and easy to understand, because traders only need to predict whether the price will go up or down within a fixed time. It offers quick results, with trades usually lasting from 1 minute to 1 hour, so profits or losses are known fast. Binary trading also allows you to start with small investment amounts, making it accessible for new traders. Another advantage is that the risk and profit are fixed in advance, so traders know exactly how much they can win or lose before entering a trade. It also provides the flexibility to trade different assets like currencies, commodities, stocks, and indices at any time. However, despite these advantages, binary trading still involves high risk and requires proper strategy and discipline.

BASIC CANDLESTICKS PATTERNS

candlesticks patterns are crucial in technical analysis as they provide indights in to the market sentiment helping trader make informed decisions here are 10 main important type of candlestick pattern along with explanations for each

Candlestick patterns are an important tool in binary option trading because they help traders predict short-term price movements and decide whether to place a Call (up) or Put (down) trade. These patterns are formed by price movements on charts and show the behavior of buyers and sellers in the market. Common patterns such as hammer, shooting star, doji, bullish engulfing, and bearish engulfing can indicate possible trend reversals or continuations. Traders often use these patterns on short time frames like 1-minute or 5-minute charts to identify quick trading opportunities. By understanding candlestick patterns and combining them with proper analysis, traders can improve their chances of making more accurate binary option trades.

IMPORTANT CANDLESTICK PATTERNS

Doji Pattern

A Doji candle is a candlestick pattern in trading that shows indecision in the market, where the opening price and closing price are almost the same. This creates a candle with a very small body and upper or lower shadows. A Doji indicates that buyers and sellers are equally strong, and the market may change direction soon. In binary option trading

Standard doji

A Standard Doji is a candlestick pattern where the opening price and closing price are nearly the same, forming a very small or almost invisible body with small upper and lower shadows. It shows that buyers and sellers are balanced

Standard
Doji

Long legged doji

A Long-Legged Doji is a candlestick pattern where the opening and closing prices are almost the same, but the candle has very long upper and lower shadows. This pattern shows that during the trading period the price moved strongly both up and down, but finally closed near the starting price. It indicates high market volatility and strong indecision between buyers and sellers

Long Legged
Doji

Dragonfly doji

A Dragonfly Doji is a candlestick pattern where the opening price, closing price, and high price are nearly the same, while the candle has a long lower shadow and little or no upper shadow. This pattern shows that sellers pushed the price down during the trading period, but buyers came back strongly and pushed the price up to the opening level. It usually indicates a possible upward reversal, especially when it appears after a downtrend

Dragonfly Doji

Gravestone doji

A Gravestone Doji is a candlestick pattern where the opening price, closing price, and low price are nearly the same, while the candle has a long upper shadow and little or no lower shadow. This pattern shows that buyers pushed the price higher during the trading period, but sellers came in strongly and pushed the price back down to the opening level. It usually indicates a possible downward reversal, especially when it appears after an uptrend

Gravestone
Doji

Hammer candle

A Hammer candle is a bullish candlestick pattern that usually appears after a downtrend and signals a possible price reversal to the upside. It has a small body near the top of the candle and a long lower shadow, with little or no upper shadow. The long lower wick shows that sellers pushed the price down, but buyers came back strongly and pushed the price up near the opening level. This indicates that the market may start moving upward

Hanging man

A Hanging Man is a bearish candlestick pattern that usually appears after an uptrend and signals a possible price reversal to the downside. It looks similar to a Hammer candle, with a small body near the top and a long lower shadow, but its meaning is different because of its position in the trend. The long lower wick shows that sellers pushed the price down during the session, although buyers managed to close it near the opening price. This indicates that selling pressure is starting to increase

Inverted hammer

An Inverted Hammer is a bullish candlestick pattern that usually appears after a downtrend and signals a possible price reversal to the upside. It has a small body at the bottom and a long upper shadow, with little or no lower shadow. This pattern shows that buyers tried to push the price higher during the trading period, although sellers pulled it back near the opening price. The buying pressure indicates that the market may start moving upward

Headless candle

A Headless candle is a candlestick pattern that has no upper shadow (no wick on top), meaning the high price is the same as the opening or closing price. This shows that the price did not move higher than the body of the candle during that period. A headless candle can be bullish or bearish depending on its color. A bullish headless candle (green) indicates strong buying pressure, while a bearish headless candle (red) indicates strong selling pressure

Tailless candell

A Tailless candle is a candlestick pattern that has no lower shadow (no wick at the bottom), meaning the low price is the same as the opening or closing price.

This shows that the price did not move lower than the body of the candle during that time period. A tailless candle can be bullish or bearish depending on its color. A bullish tailless candle (green) indicates strong buying pressure, while a bearish tailless candle (red) indicates strong selling pressure

Bullish candel

A Bullish candle is a candlestick pattern that shows the price has moved upward during a trading period, meaning the closing price is higher than the opening price. It usually appears as a green or white candle on the chart and indicates that buyers are stronger than sellers in the market. A bullish candle suggests that the price may continue to move upward, especially if it appears during an uptrend or after a support level

Bearish candel

A Bearish candle is a candlestick pattern that shows the price has moved downward during a trading period, meaning the closing price is lower than the opening price. It usually appears as a red or black candle on the chart and indicates that sellers are stronger than buyers in the market. A bearish candle suggests that the price may continue to move downward, especially if it appears during a downtrend or near a resistance level

Price Prediction

Price prediction means estimating whether the price of an asset (like stocks, forex, gold, or indices) will move up or down in the future by analyzing market data. Traders usually predict price movement using technical analysis, which includes studying candlestick patterns, trends, support and resistance levels, and indicators such as Moving Average . By understanding these signals, traders try to identify the best time to buy or sell. In binary option trading, price prediction is very important because traders must decide whether the price will go up (Call) or down (Put) within a short time period

SUPPORT AND RESISTANCE

LEVELS : ENTRY AND EXIT POINT

Support and resistance are important concepts in trading used to identify price levels where the market often stops or reverses direction. Support is the price level where the market tends to stop falling and may start moving upward, because buyers become stronger at that level. Resistance is the price level where the market tends to stop rising and may start moving downward, because sellers become stronger there. Traders use support and resistance levels to predict future price movements and find good entry points. In binary option trading, traders may take a Call (up) trade when the price bounces from a support level and a Put (down) trade when the price rejects from a resistance level, especially when confirmed by candlestick patterns.

Support

Support is a price level in trading where the market tends to stop falling and may move upward again. It is called support because this level acts like a floor for the price, where buyers become stronger and prevent the price from going lower. When the price reaches a support level, it often bounces back up, showing that demand is higher at that price. Traders use support levels to identify good buying opportunities. In binary option trading, if the price touches a support level and shows upward movement or bullish candles, traders may consider taking a Call (up) trade after confirmation.

Resistance

Resistance is a price level in trading where the market tends to stop rising and may move downward again. It is called resistance because this level acts like a ceiling for the price, where sellers become stronger and prevent the price from moving higher. When the price reaches a resistance level, it often moves back down, showing that selling pressure is higher at that price. Traders use resistance levels to identify selling opportunities. In binary option trading, if the price touches a resistance level and shows downward movement or bearish candles, traders may consider taking a Put (down) trade after confirmation.

TYPES OF MARKET

There are mainly three types of markets in trading based on price movement:

Uptrend Market (Bullish Market)

In an uptrend market, the price moves upward continuously, making higher highs and higher lows. Buyers are stronger than sellers, and the market shows a rising direction. In this type of market, traders usually look for buy or Call (up) opportunities.

Downtrend Market (Bearish Market)

In a downtrend market, the price moves downward continuously, making lower highs and lower lows. Sellers are stronger than buyers, and the market shows a falling direction. In this type of market, traders usually look for sell or Put (down) opportunities

Sideways Market (Range Market)

In a sideways market, the price moves between support and resistance without a clear upward or downward trend. Buyers and sellers are almost equal, and the market moves in a range. Traders often trade between support and resistance levels in this type of market.

Sideways Trend

MONEY MANAGEMENT & RISK

MANAGEMENT

Money management and risk management are very important in trading because they help traders protect their capital and reduce losses. Money management means deciding how much money to invest in each trade so that you do not lose all your funds quickly. Traders usually risk only a small percentage of their total balance (for example 2%-5%) per trade to stay safe. Risk management means controlling possible losses by using proper planning, discipline, and strategies. It includes setting limits on losses, avoiding overtrading, and trading with a clear plan. Good money and risk management help traders stay in the market for a long time and trade more safely, especially in high-risk trading like binary options.

Capital Investment

The first important money management to investment capital first you don't to trade you 100% capital use like a 50% to 60% of your investment capital

Risk On Trade

ONLY RISK A 2% TO 5% OF YOUR TOTAL CAPITAL
LIKE A YOUR CAPITAL IS \$100 YOU WILL TAKEN ONLY \$2 TO \$5

Daily profit targeting

YourKeep your profit target around 10% of your capital and avoid overtrading. This helps protect your account and maintain disciplined trading.
paragraph text

Emosally Trading

Do not trade emotionally. Always trade with a clear plan and discipline, and avoid making decisions based on fear or greed.

Educate Yourself

Always educate yourself in trading before investing money. Learn about market basics, candlestick patterns, support and resistance, risk management, and trading strategies. Improve your knowledge step by step. Proper education helps you make better trading decisions and reduces the chances of loss.

right way to use sure patterns

up trend buy set-up

live chart set-up

down trend sell set-up

live chart set-up

MAGIC V PATTERN

TRADE SETUP FOR UP AND DOWN

LIVE EXAMPLE ON CHART

MTG – 1 STEP

If the trade is lost only take MTG if the stochastic oscillator is supporting your direction of the trade.

If the MTG is lost look for a new opportunity.

FOR UP-DIRECTION TRADE **BUY SETUP**

LIVE EXAMPLE ON THE CHART

FOR DOWN-DIRECTION TRADE **SELL SETUP**

LIVE EXAMPLE ON THE CHART

FOR UP-DIRECTION TRADE **BUY SETUP**

Important Note – If 3 red candle appears pattern is not valid

If after 2 red candle green candles break the horizontal line pattern is invalid

Make sure if all condition are satisfied enter in trade if stochastic is supporting your direction

LIVE EXAMPLE ON THE CHART

Important Note – Make sure to check the stochastic indicator green line should be above red line.

FOR UP-DIRECTION TRADE **BUY SETUP**

Important Note – Make sure the breakout only through the body is valid.

LIVE EXAMPLE ON THE CHART

Important Note – Make sure the breakout only through the body is valid.

FOR DOWN-DIRECTION TRADE **SELL SETUP**

NON MTG PATTERN

The market will give you a sure-shot trade if lose then don't take the MTG trade.

Make sure the breakout only through the body is valid.

LIVE EXAMPLE ON THE CHART

Important Note – Make sure the breakout only through the body is valid.

FOR UP-DIRECTION TRADE BUY SETUP

Important Note – Always check the stochastic indicator before placing trade for up direction market green line should be above red.

LIVE EXAMPLE ON THE CHART

Important Note – Always check the stochastic indicator before placing trade for up direction market green line should be above red.

FOR DOWN-DIRECTION TRADE **SELL SETUP**

Important Note – Always check the stochastic indicator before placing trade for down direction market red line should be above green.

LIVE EXAMPLE ON THE CHART

Important Note – Always check the stochastic indicator before placing trade for down direction market red line should be above green.

Color Pattern

Requirements –

1. The market should be in Ranging Motion or Stack
2. Then wait for the market to make a green-red color pattern
3. Then check the overall trend then place the trade
4. In the overall trend following the color pattern

FOR DOWN-DIRECTION TRADE **SELL SETUP**

FOR UP-DIRECTION TRADE **BUY SETUP**

Requirements –

1. The market should be in trending motion
2. Then apply Moving Average EMA 5
3. Apply Parabolic at default 0.02
4. Also apply stochastic indicator at 80 , 20

5 EMA – will indicate how strong buyers and sellers in the market

Stochastic Indicator will give you the direction of the Market

Once a strong candle breaks the EMA 5 line and parabolic is supporting the same direction and even stochastic indicator is supporting the same direction

You can place a trade in same direction until opposite colour candle crosses EMA 5.

Requirements –

1. The market should be in trending motion
2. Then apply Moving Average EMA 5
3. Apply Parabolic at default 0.02
4. Donchain channel at period 17
5. Also apply stochastic indicator at 80 , 20

5 EMA – will indicate how strong buyers and sellers in the market

Stochastic Indicator will give you the direction of the Market

For up direction – Make sure market is in uptrend and in upper channel of donchain channel then wait for a tailless candle to appear

Check if parabolic and stochastic is supporting the same direction then place a trade

1- Step MTG can be used if condition is perfect
